

Ear Irrigation

Patented ear irrigation tool developed to safely and thoroughly clear the ear canal of wax and debris. The ear irrigation tip sprays three divergent streams of water towards the walls of the ear canal, not directly at the eardrum. Older irrigation methods shoot out a single stream of water directly into the ear creating a high risk of damage to the eardrum.

Features & Benefits

- No risk of damage to the eardrum as water is dispersed at a 45° angle.
- 3 streams of water generate a Whirlpool effect flushing out the wax.
- Impossible to over-insert into the ear canal due to the flare-tip design.
- Stay clean & dry with exit portals that let the water and debris drain in a controlled manner.
- Personal comfort through the soothing sensation of a plastic receptacle that feels even better than the cap from a ball point pen.
- Easy use – ability to be operated with one hand.
